Climate Analytics Platform Training

Two companion series cover this project. They share one platform but answer different questions.

Series	Question it answers	Audience
Technical Series	*How is the platform built?* Data science and ML, the API, Streamlit and React dashboards, the MCP server, and the conversational agent — concepts, implementation, testing, deployment.	Engineers and data scientists building or extending the platform
Functional Series	*What does the platform tell us about climate change?* The domain, the data sources, the methodology, how the results compare with IPCC/COP/other benchmarks, the Paris Agreement targets, and what the platform's trends imply for them.	Analysts, policy-minded readers, and anyone interpreting the dashboards

Suggested reading paths

- **Understand the results:** Functional Series, in order.
- **Build or extend the platform:** start with the Architecture Overview, then the area you need.
- **Both:** read the Functional README for the domain, then the technical Data Science and ML area to see how the data and models are produced.

Rebuilding the PDFs

Every `.md` has a PDF twin. See `_build/README.md` to regenerate them after an edit.
